

## **Pairs**

After making all the data numeric I proceed to run the pairs command to sort the program to see which pairs of data went well together.

Giving some scatter plot indications on how the data meshed with each other.

This made me want to focus on how all the other variables in the data affected the math, reading, and writing scores as those seem to be the most affected by the other variables.

Began to make multiple histograms comparing male and female scores and the scores of those who had lunch and the free/reduced lunch
